Claims as Amended:

Please cancel claim 12 without prejudice.

9. A mount for an adjustable housing in which a position of the housing on the mount is adjustable, comprising a base plate; at least one adjusting screw for adjusting the position of the housing, said adjusting screw being guided by a screw thread through the base plate, said at least one adjusting screw being provided with a deflecting linkage; a rotary spindle guided on said base plate by said deflecting linkage, said rotary spindle being turnable in order to turn said at least one adjusting screw in said screw thread to provide an adjustment of the position of the housing, said deflecting linkage including bevel gears, and at least one of said bevel gears being mounted on said adjusting screw and movable and pressable against the other of said bevel gears; and an element for moving said at least one bevel gear on said adjusting screw and pressing said at least one bevel gear on said adjusting screw against said other bevel gear, wherein said element is formed as a spring, wherein said deflecting linkage is operative for producing a deflection of a rotary motion of said rotary spindle approximately at a right angle so that rotation of said rotary spindle takes place approximately perpendicular to the emission direction.

Amend as follows:

IN THE CLAIMS:

Please cancel claim 12 without prejudice.

9. A mount for an adjustable housing in which a position of the housing on the mount is adjustable, comprising a base plate; at least one adjusting screw for adjusting the position of the housing, said adjusting screw being guided by a screw thread through the base plate, said at least one adjusting screw being provided with a deflecting linkage; a rotary spindle guided on said base plate by said deflecting linkage, said rotary spindle being turnable in order to turn said at least one adjusting screw in said screw thread to provide an adjustment of the position of the housing, said deflecting linkage including bevel gears, and at least one of said bevel gears being mounted on said adjusting screw and movable and pressable against the other of said bevel gears; and an element for moving said at least one bevel gear on said adjusting screw and pressing said at least one bevel gear on said adjusting screw against said other bevel gear, wherein said element is formed as a spring, wherein said deflecting linkage is operative for producing a deflection of a rotary motion of said rotary spindle approximately at a right angle so that rotation of said rotary spindle takes place approximately perpendicular to the emission direction.
